Design principles

Keep the health plan ALIVE - patients & providers communication enhanced

Right info, right person, right time - like the good doctor ordered

Easy for patient and physician - hard as heck for us

Gross anatomy...

MPL: open & computable!

Mr. Jay Elmo a 67 year old gentleman recently hospitalized with acute on chronic heart failure, diabetes, complicated with major depressive disorder and general anxiety disorder.

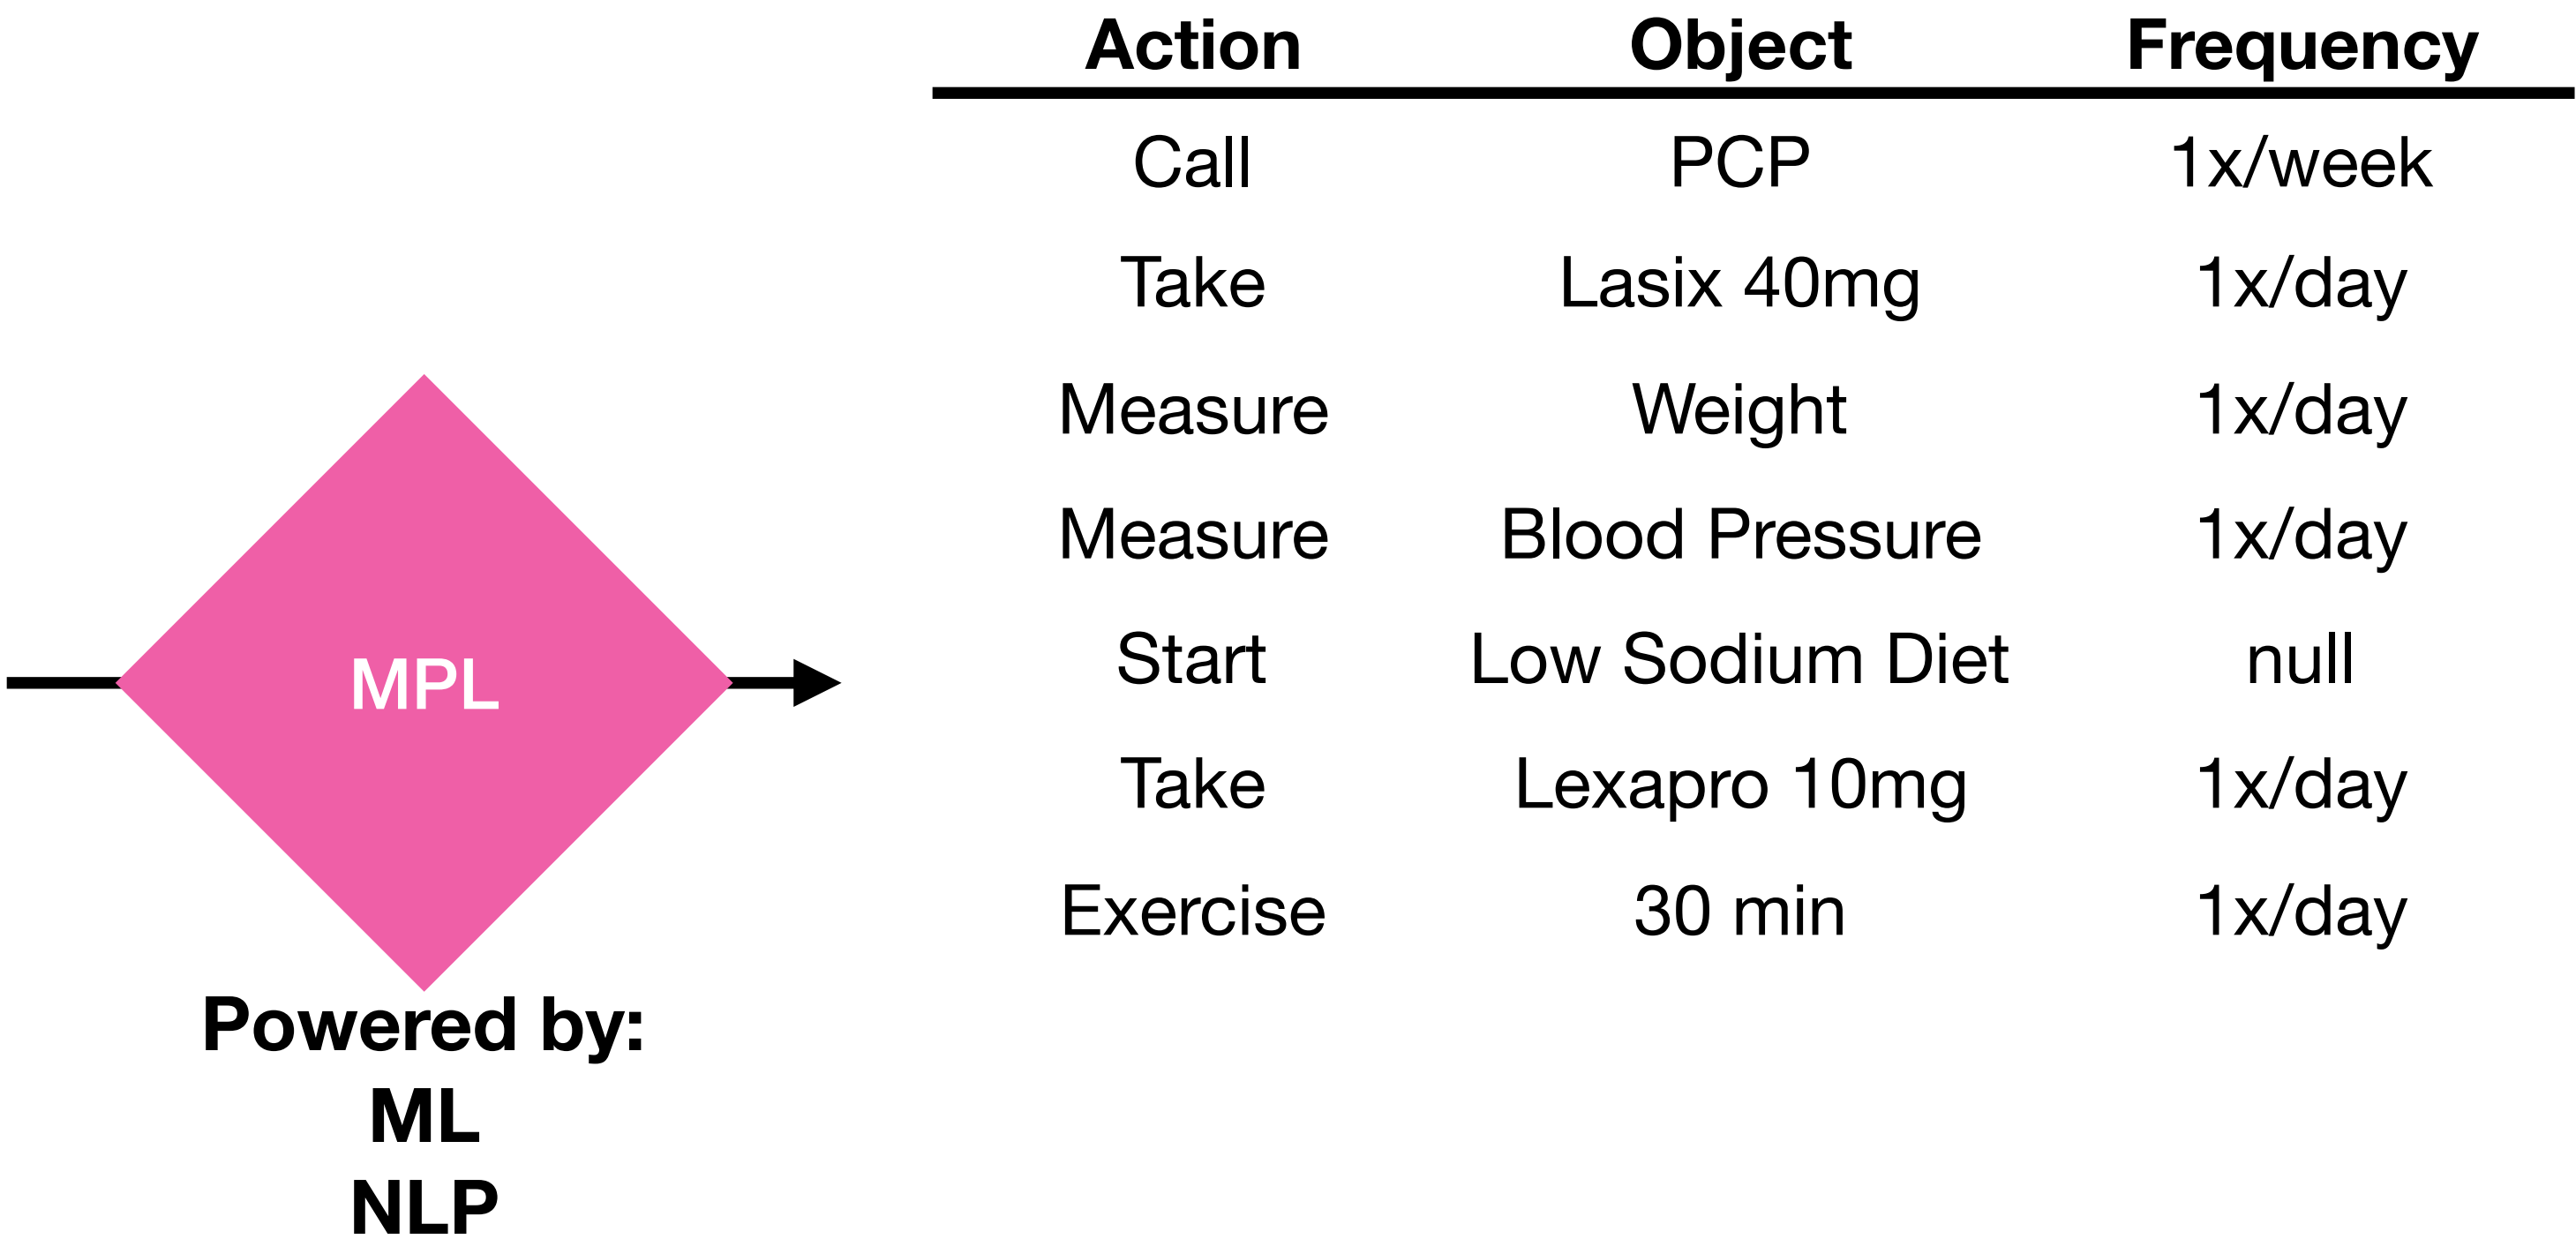

Discharge instructions for J. Elmo:

You were recently hospitalized for an exacerbation of your heart failure. Over the course of your stay we helped remove some of the extra water from your body. We would like you to follow up with your primary care physician within the next week.

For your heart failure, please continue to take Lasix (40mg) once daily. We would also like you to weigh yourself daily and also measure your blood pressure weekly. Please stay on a low-sodium diet.

For your mood we have started you on 10mg of Lexapro. This may cause some anxiety initially; however, it should subside, in 2w time you should increase the dose to 20mg.

We encourage you to incorporate 30m of daily activity. We have sent your PCP a copy of our records, please contact them if you have any questions. If you experience chest pain, severe shortness of breath, my little pony, etc. please come into the emergency department.

Exercise	Collective term for physical activity	week	
Send	Forward information to specified lab/physician	month	
Stop	Cease an activity not mentioned above	year	
Start	Begin an activity not mentioned above		
Alert	Notify PCP of specified condition		

Couldn't Epic just implement this?

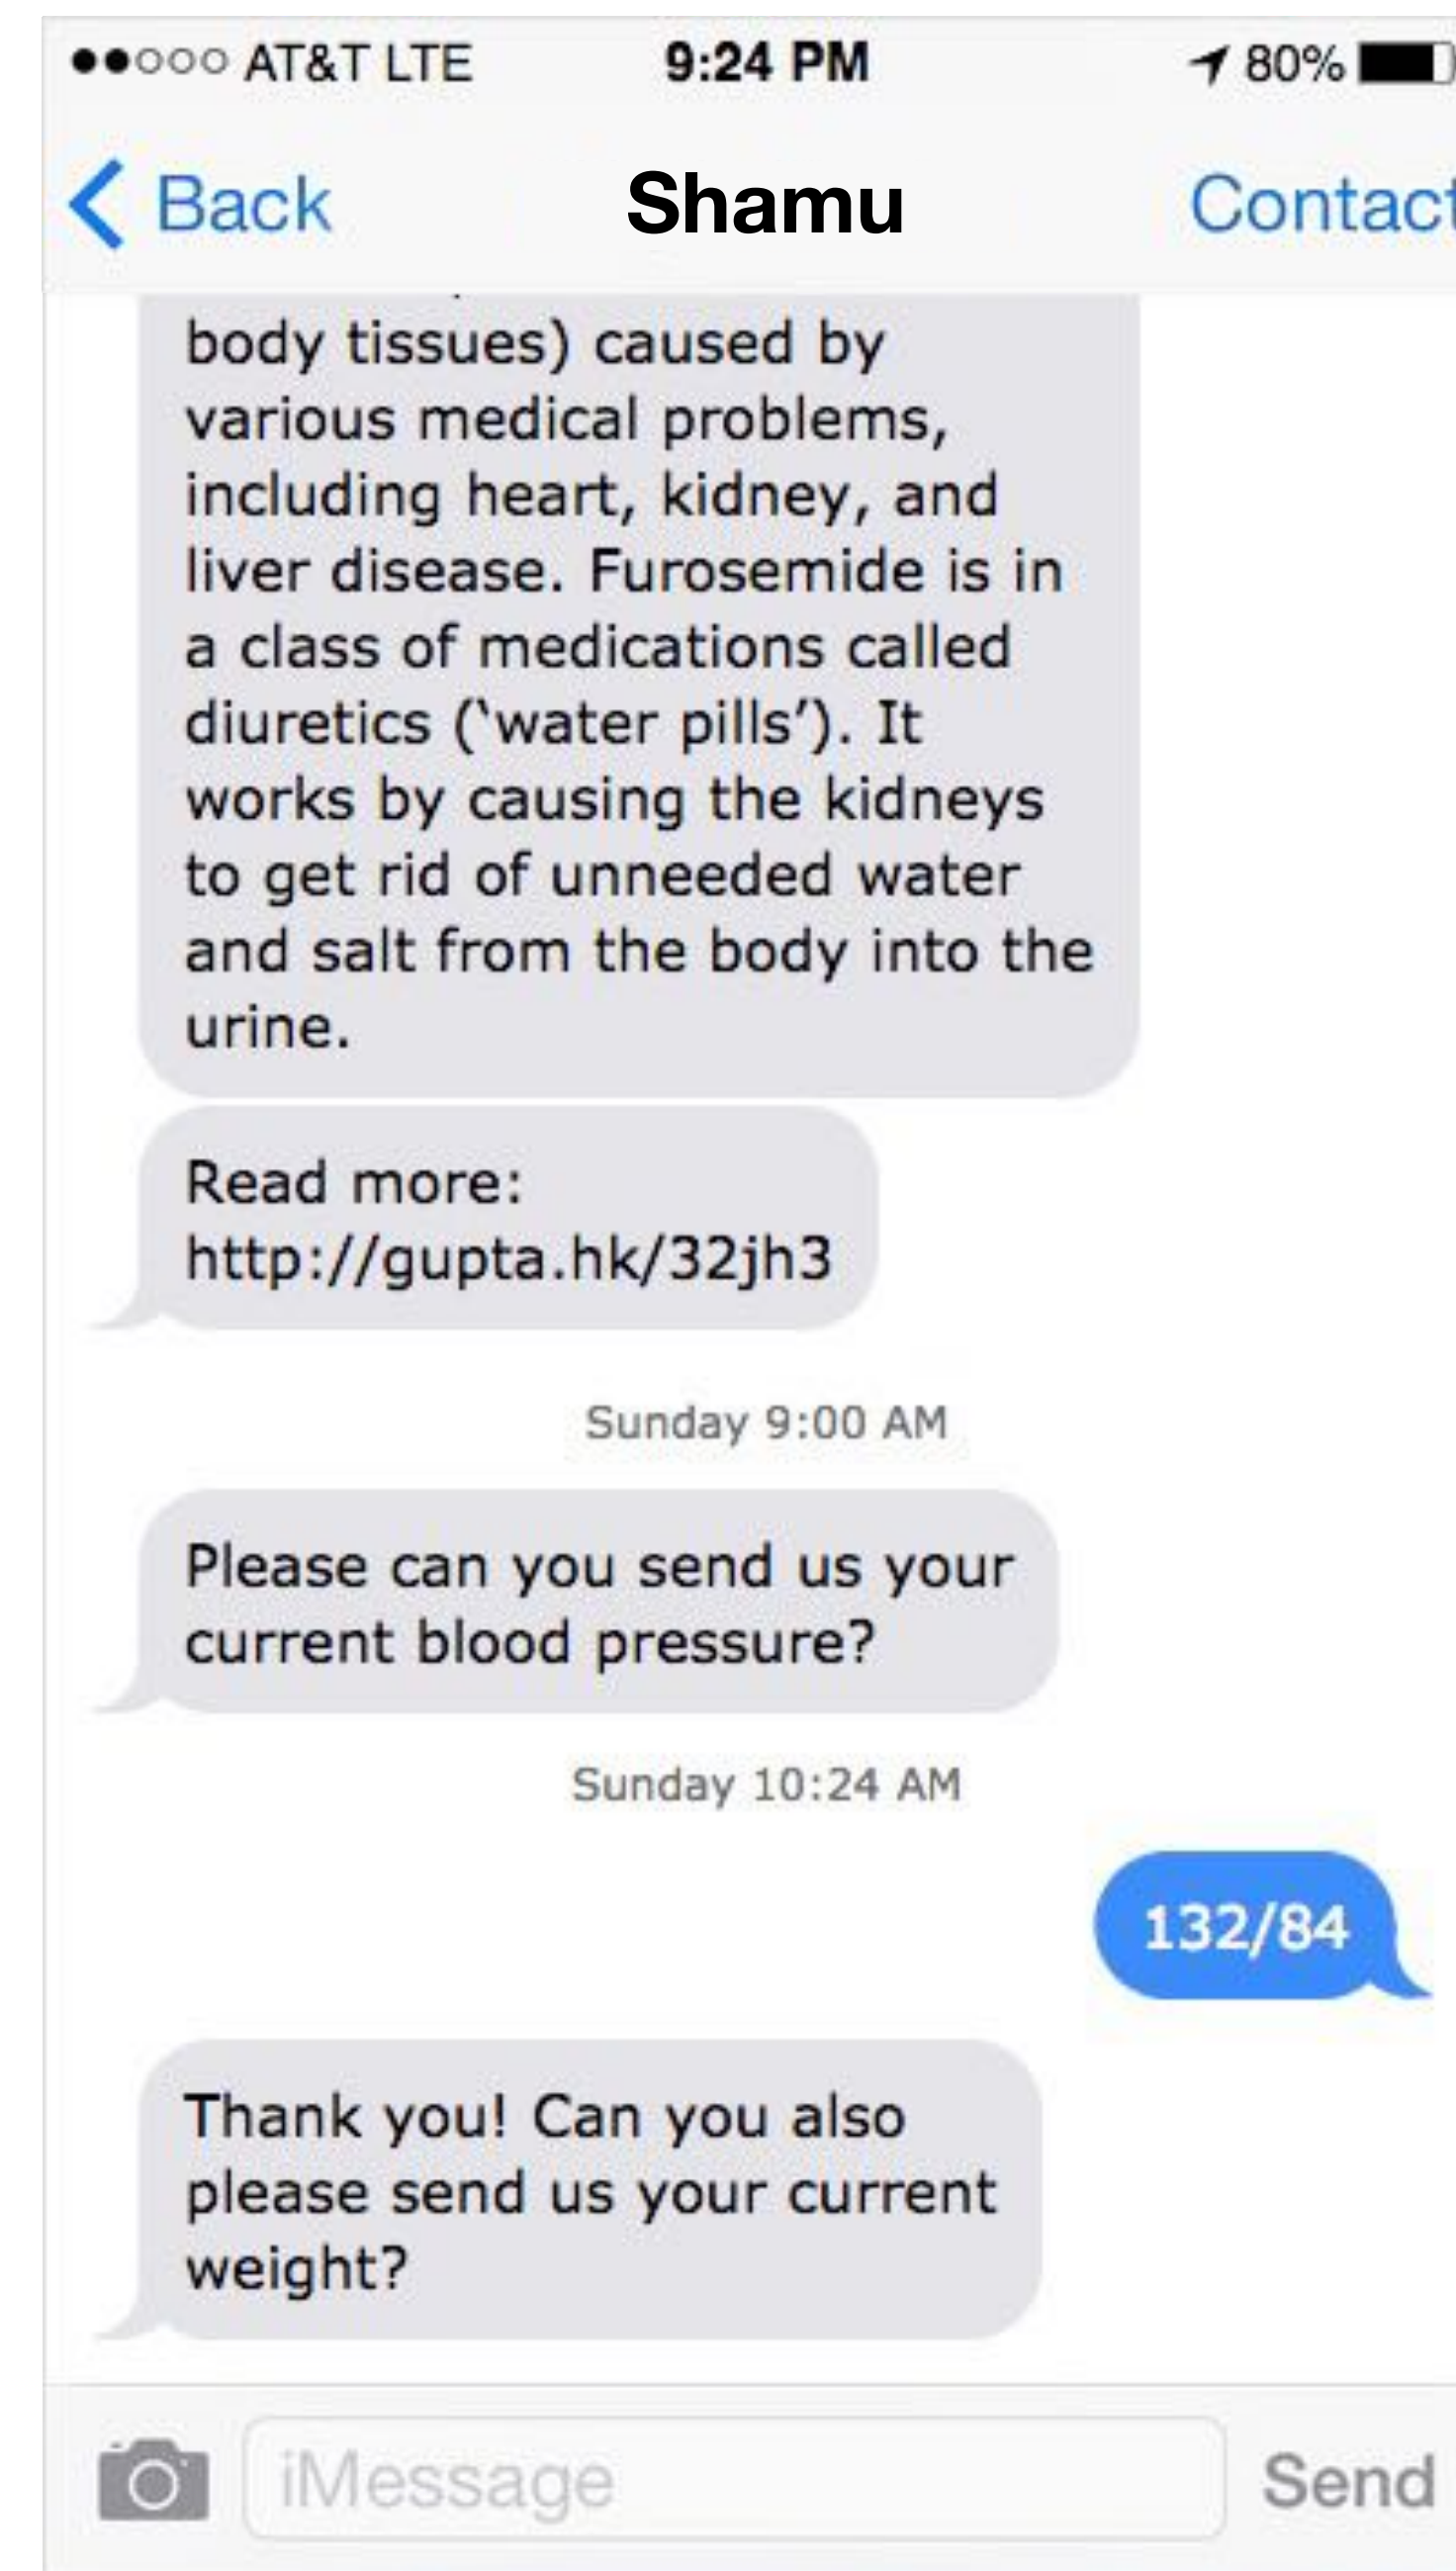

Yes!

It would be nice if they did. That would save us a lot of work.

We'd just ask that they donate the profits to ending child hunger...

Enhanced Communication

Barriers

Barriers to Implementation

Do enough people have phones to make this possible?

There are more than six billion mobile phone users worldwide with almost three quarters living in LMICs

Aren't there enough mHealth apps and systems out there?

We're not designing an app, it's a platform. Shamu is not a mobile health intervention in and of its self, rather, it's a platform on which mHealth apps can run.

Is there a real need?

To fully satisfy the USPSTF recommendations, 1773 hours of a physician's annual time, or 7.4 hours per working day, is needed for the provision of preventive services. Shamu allow for continuance of the patient provider encounter and incorporation of prevention beyond the confines of the office visit.

How will Shamu deal with liability?

Shamu will make use a simple messaging to alert users to the normal use of Shamu. See an example from MiChart below:

Do not use MyUofMHealth.org for urgent medical matters.

If you are experiencing an urgent medical problem, call 911 or your physician's office immediately.

Barriers to Implementation

Won't this increase alert fatigue?

Shamu will not increase alert fatigue as functions very similarly to a patient portal. It helps providers address more simple patient concerns more efficiently, and helps focus attention on more complex situations or concerns.

How will the system deal with protecting patient information and privacy?

Shamu will use state of the art HIPAA compliant encryption in order to maintain privacy and keep PHI secure.
